Background and Specificity:

Glycogen Synthase Kinase 3 beta (GSK3beta) is a serine/threonine kinase that is acting independently of most signal transduction pathways. The activity of GSK3beta can be modulated by phosphorylation of Ser9 and Tyr215 in the activation loop. GSK3beta plays a crucial role in phosphorylation of beta-catenin and thus is an important kinase involved in the regulation of beta-catenin/wnt-signaling.

Mab GSK3b-2D3 specifically recognizes GSK3beta phosphorylated at Ser 9 at 46 kDa in Western blot and ELISA applications. The antibody does not crossreact with GSK3alpha pSer21.

Phosphospecificity

Whole cell extracts of control (co) and pervanadate (VH) treated A431 tumor cells were applied to SDS-PAGE (ca 20.000 cells per lane) and transferred to PVDF membranes. Immunoblots were probed with mab GSK3b-2D3 (0.5 µg/ ml) for 1h at RT and developed by ECL (exp. time: 30 sec).
