Background and Specificity:

Glycogen Synthase Kinase 3 beta (GSK3beta) is a serine/threonine kinase that is acting independently of most signal transduction pathways. The activity of GSK3beta can be modulated by phosphorylation of Ser9 and Tyr215 in the activation loop. GSK3beta plays a crucial role in phosphorylation of beta-catenin and thus is an important kinase involved in the regulation of beta-catenin/wnt-signaling.

Mab GSK3b-6D3 specifically recognizes GSK3beta phosphorylated at Tyr 215 at 46 kDa and GSK3alpha phosphorylated at Tyr 278 at 54 kDa in Western blot applications.
