POLYMERIZING CYCLED TUBULIN™

Materials:
- Cycled Tubulin™ (Cat. No. PUR-032005)
- Tubulin PEM Buffer (Cat. No. PUR-032002; 80 mM PIPES, 1 mM EGTA, and 1 mM MgCl2, pH 6.8)
- DTT
- GTP or GMPCPP
- Taxol (optional)

Equipment:
- Water bath at 37°C

Technical Notes:
- Avoid diluting tubulin beyond its critical concentration
- If stabilized microtubules are desired, either polymerize with GMPCPP or stabilize with Taxol
- Add Taxol stepwise to avoid precipitation
- Do not place polymerized microtubules on ice

Protocol:

1. Assemble the Polymerization Reaction
   a) Dilute Cycled Tubulin™ to 2 mg/ml with Tubulin PEM Buffer
   b) Add DTT and guanosine (GTP or GMPCPP) to 1 mM each
   c) Incubate on ice for 5 minutes

2. Polymerize
   a) Incubate in a 37°C water bath for 1 hour

3. Stabilize with Taxol (optional)
   a) Add 1/10 volume Taxol at 2 uM, incubate in a 37°C water bath for 10 minutes
   b) Add 1/10 volume Taxol at 20 uM, incubate in a 37°C water bath for 10 minutes
   c) Add 1/10 volume Taxol at 200 uM, incubate in a 37°C water bath for 15 minutes

*include Taxol to 200 uM in subsequent buffers
